From Goede award to the “car of the future”

All experience in the history of mankind shows:
The feasible has ever been made, is always made, and will always be made. Somewhere, somehow, today, tomorrow (and then maybe more professional).
It will be made, regardless of whether all underlying experimental key facts are known, a phenomenological description exists, the theoretical background is understood, the consequences and risks are containable.
In fact, especially **when it promises just** a whiff of lead, advantage, benefit, profitability, exclusivity, fame.
And there is no return to the “innocent before”, when Pandora’s box is opened.

“Creativity is to see what everyone else has seen and think what no one else has thought before.”
Albert Szent-Gyoergyi

“The Goede award - **1 Million Euro** to overcome gravity
The “Goede award for gravity research” is an innovative prize. The intent of this prize is to influence gravity with presently unknown methods. Applicants must successfully design, construct and complete an experiment with specified performance characteristics.
A 20 gram heavy device or the assembly itself, is required to float freely at least 1 minute at a minimum distance of 10 cm from any surface.”

(english version below)
Nehmen wir an, das Goede-Problem sei gelöst, die geforderte Anordnung, ein Antigravgenerator, z.B. als Metamaterial-, als nanotechnologische oder als Turbofan-Konstruktion arbeite stabil und sei erweiterungsfähig.

! Welche Auswirkungen einer solchen MegaEntdeckung wären nach einer technologischen Inkubationszeit für den erdgebundenen Verkehr (“das Auto der Zukunft”) prognostizierbar?

! Gibt es darüber in der Literatur und im Internet belastbare Überlegungen und Aussagen?
Wenn ja, stellen Sie dazu ein Dossier zusammen.

Let us assume the Goede problem has been solved, the required assembly, - an antigravity generator -, f.e. a metamaterial or a nanotech or a turbofan device, would work stable and would be expandable.

! Which impact of such a MegaDiscovery would be predictable for the earthbound traffic (future cars) after a technological incubation time?

! Can you find reliable speculations and statements about this in journals and on the internet?
If yes, compile a dossier about these.
