In the debating club 3

Imagine you, you have a sheet of paper and a compass. It is then very simple to draw exactly a circle with a radius of 5 cm. But now you are standing on the sports ground of your school and your problem is: you should “draw by foot” a large chalk circle as exactly as possible. No central point is given, and you haven´t any tool (roop, etc). You are on your own “local navigation operator”. How do you do it?
